

Morgan James

Full-Stack Software Developer | Unity · C# · Azure · XR · CI/CD · REST APIs

+1 (203) 540-4758 • morganhmjames@gmail.com • linkedin.com/in/morganhjames • morganjames.dev • github.com/MorganHJames

PROFESSIONAL SUMMARY

Full-stack software developer with 9+ years shipping production applications across VR training platforms, satellite mission control, consumer games, and industrial simulators. Experienced across the entire pipeline — from SDK and runtime architecture to backend integration, QA automation, and cross-platform deployment — with a consistent track record of building systems that scale, tools that empower non-technical teams, and experiences that put the user first. Keeps current with AI developments, with hands-on experience integrating LLM APIs and building ML models.

TECHNICAL SKILLS

Languages: C#, C++, HLSL, Python, HTML, CSS, JavaScript, TypeScript, SQL

Engines & Frameworks: Unity 3D (HDRP / URP / Built-In RP), Unreal Engine 5, ShaderGraph, XR Plugin Management, Addressables / AssetBundles, React, Vite, Node.js, Express

Cloud & Backend: Microsoft Azure, REST API design and integration, AWS (S3, EC2), WebSocket, PostgreSQL, Railway, Google Maps API, Momentum IoT GPS integration

CI/CD & DevOps: Jenkins, GitHub Actions, Azure DevOps, Git, Docker, build automation scripting

Testing & QA: Unity Test Runner, NUnit, AutoDriver, deterministic replay systems, manual regression testing

AI & Machine Learning: LLM API integration, CNN implementation, AI-assisted development workflows (GitHub Copilot, Cursor, Claude)

Platforms: Meta Quest (OpenXR), Pico VR, Android, iOS, WebGL, Windows Standalone, Web Applications

Tools & Process: Agile / Scrum, Jira, technical documentation, SDK design, code reviews, Blender / 3DS Max, Vuforia, Photon

WORK EXPERIENCE

Full-Stack & Solutions Engineer | May 2026 - Present

Abbey Tent & Party Rentals | Fairfield, CT

- Identified operational inefficiencies through direct experience as a delivery driver and designed a full-stack dispatch management system from scratch to automate and accelerate manual scheduling workflows
- Built a React/Vite frontend, Node.js/TypeScript/Express backend, and PostgreSQL database deployed on Railway, featuring multi-user authentication, role-based access, and real-time WebSocket sync
- Integrated the Momentum IoT GPS API to provide live vehicle tracking and per-vehicle route visualisation across the fleet, enabling real-time visibility for dispatchers
- Implemented schedule import from existing systems, automated dispatch sheet generation, intelligent run-based order assignment, and an auto-planner algorithm that suggests optimal vehicle and crew allocation
- Enabled per-employee and per-vehicle daily schedule views accessible via web, replacing paper-based processes and reducing dispatch preparation time significantly

Senior Unity Developer | Apr 2022 - Oct 2025

Transfr | New York City, NY, USA

- Co-developed a no-code SDK enabling ~6 in-house XR Designers and multiple outsourced studios to create VR training simulations independently, scaling the content pipeline to 330+ simulations across 1,110 locations nationwide
- Contributed to vocational simulations spanning welding, semiconductor production, and surgery, part of a platform delivering 500,000+ simulations to 250,000+ learners since launch
- Introduced AutoDriver to the QA team, replacing time-intensive manual headset testing with automated interaction verification
- Designed and implemented the unified launcher from scratch, reducing time to enter a simulation by several minutes per learner and consolidating all products into a single entry point
- Authored SDK documentation enabling non-technical content creators and external partner studios to integrate independently

Unity Software Developer | Jan 2022 - Mar 2022

Space Forge | Cardiff, Wales, UK

- Designed and developed a mission control UI aggregating live telemetry, weather patterns, and hazard zones into a single interactive globe
- Prototyped an AR-assisted manufacturing assembly workflow using Vuforia; validated as a cost-reduction pilot by engineering leadership
- Integrated back-end data feeds with the front-end interface to produce a dynamic, user-specific mission profile display system

Graphics Programmer | Aug 2021 - Jan 2022

3t Drilling Systems | Bournemouth, England, UK

- Debugged and resolved graphical issues across simulator deployments ensuring stable rendering across 60+ countries and 1,500+ deployed simulators
- Engineered and implemented a branding asset-swap system adopted by the majority of major enterprise clients
- Provided deployment and performance support across three continents for clients including Shell, Chevron, and BP

Unity VR Developer | Jun 2020 - Jun 2021

The Open University | Milton Keynes, England, UK

- Delivered 12 VR simulations including venepuncture, catheterisation, wound care, and phlebotomy, deployed on Oculus Quest
- Established core VR infrastructure enabling the wider team to focus on simulation content rather than engine plumbing
- Implemented a deterministic replay system allowing bugs to be reproduced reliably without manually redoing lengthy interaction sequences

Unity Developer | Jul 2018 - Jul 2019

DTT | Amsterdam, Netherlands

- Assisted in the development and launch of 6 applications and games across iOS, Android, and WebGL
- Personally contributed to Edu Play Book, Flip Puzzle, and At Mouse's House, three shipped consumer applications
- Developed a CMS integration eliminating developer involvement from the content update cycle entirely
- Built Flip Puzzle's level editor and online level-sharing system including the Web API for community-created stages

EDUCATION

Bachelor of Science (BS) in Computer Game Programming with First Class Honours

University of Gloucestershire, Cheltenham, UK | 2020

ACHIEVEMENTS & ADDITIONAL

- Most Recognised Mentor — MIT Reality Hackathon 2025
- Unity Shader Tutorial on YouTube: 25,000+ views, 95% positive rating
- Published shipped titles on Google Play and Apple App Store (Card Cavern, Loot Swipe)
- Epic MegaJam 2025: Mogi's Inferno — shipped Unreal Engine 5 game in a one-week jam
- Final year research project: real-time CNN facial emotion detection used as game input (Emotional Speed Dating)
- Dual US / UK citizen
